## *TalkBox Configurator* User Manual

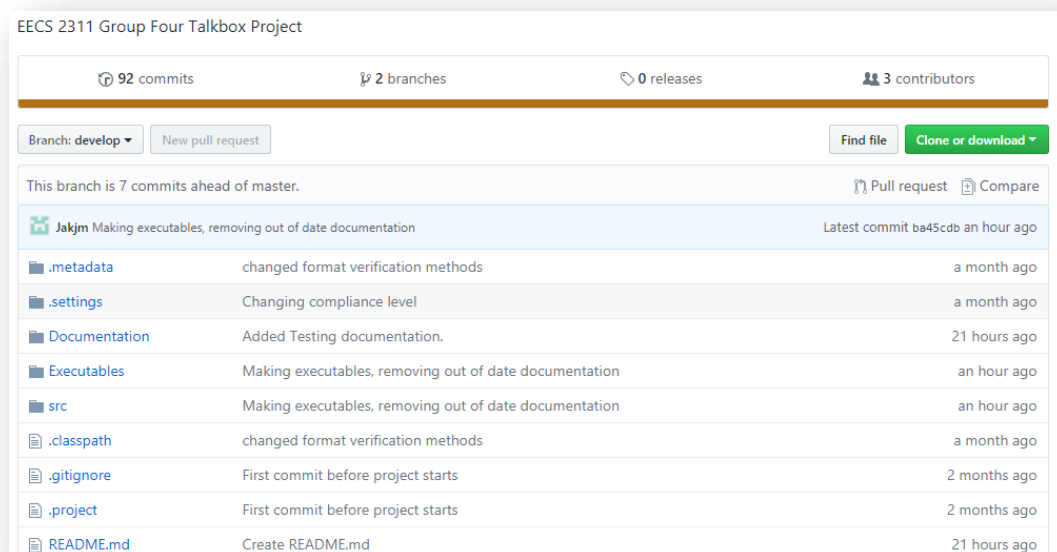

**T**alkbox is a highly customizable virtual lexigram interface that allows persons with speech disabilities to communicate. The configurator is rich with features to customize the appearance, functionality, feel of the audio buttons.

### 1 Installation Instructions

*Prerequisite:* **Java** must be installed. Click [here](#) to install.

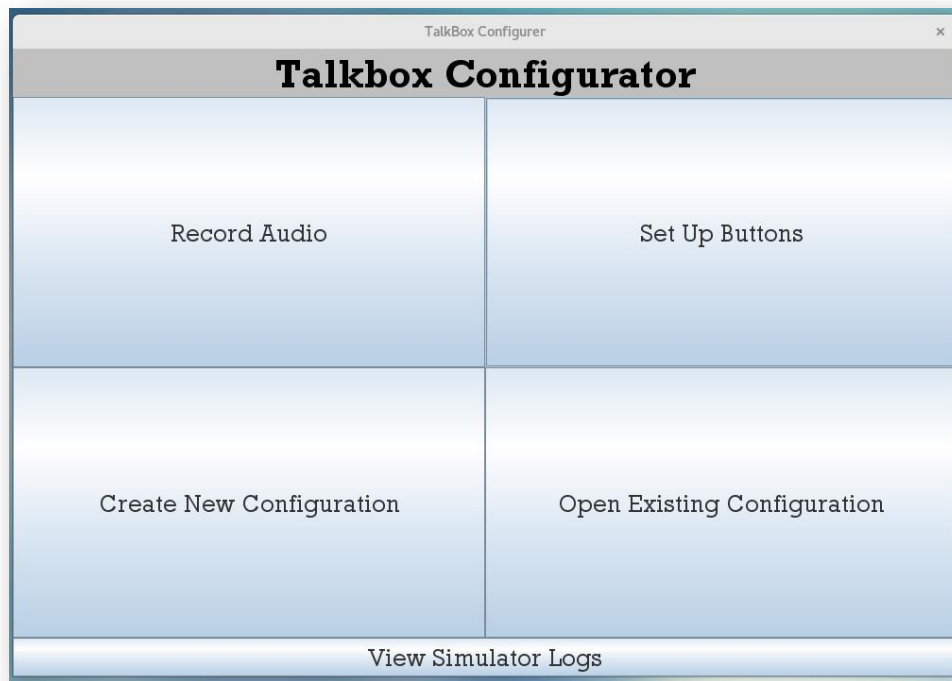

To install the software, please visit the *Talkbox* project site at <https://github.com/Jakjm/Talkbox> and download and extract the zip folder. In the **Executables** folder, there are three core applications: The *Talkbox Configurator*, *Talkbox Simulator*, and *TBC Log*.

*Under the ‘Clone or download’ dropdown, click Download Zip.*

## 2 Using the Configurator

*In this configuration menu there are five buttons.*

**Record Audio**—the purpose of this panel is to record phrases and words that can be used for the buttons. After recording, the user must save the audio file on their computer (but not the *Talkbox* directory— it will not recognize it). Alternatively, these sounds can be recorded within the *Set Up Buttons* panel.

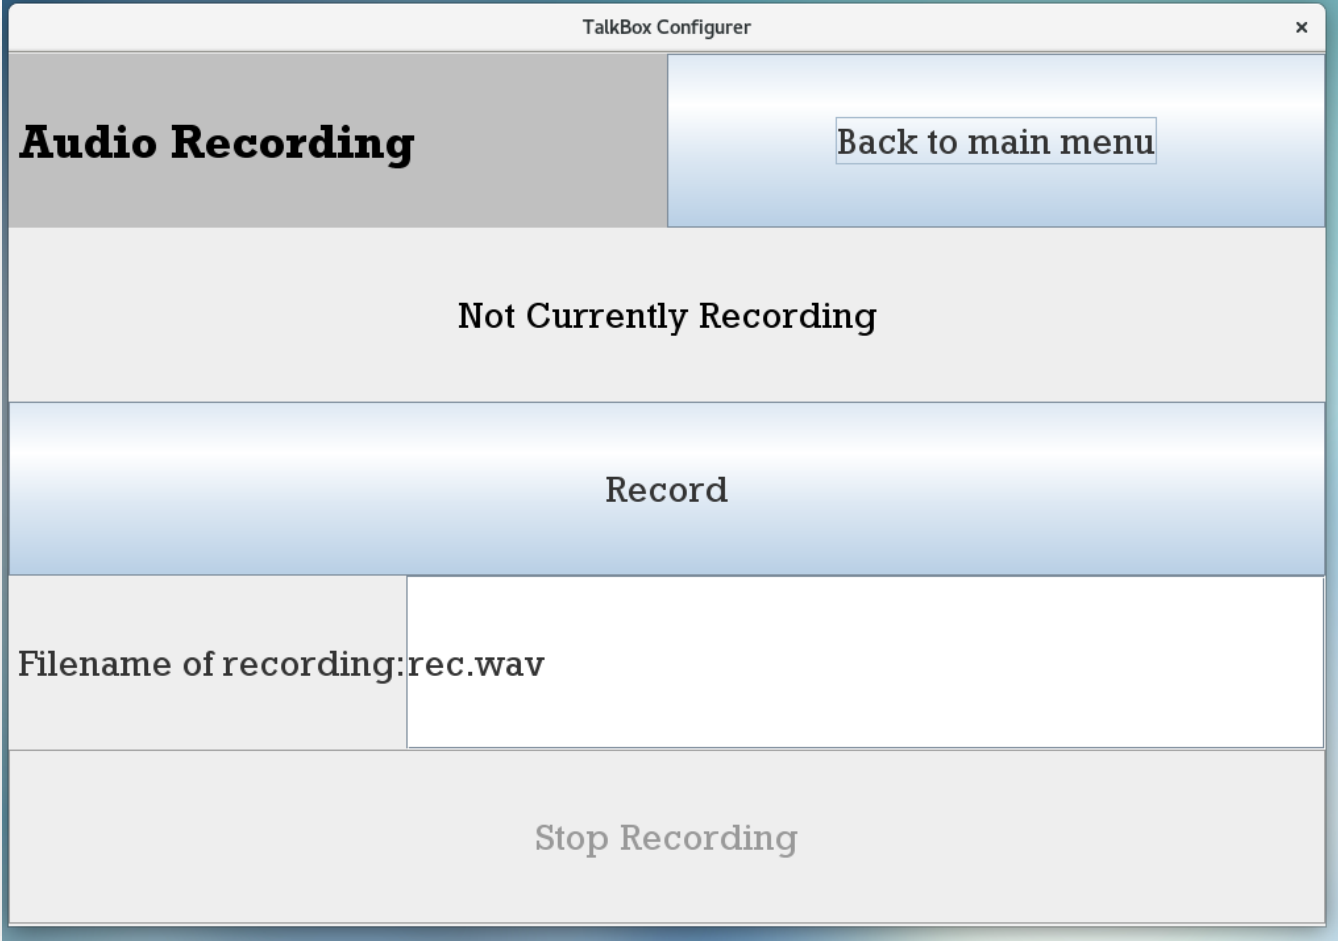

The user can name the audio file to whatever they want. At this time only *WAVE* files can be used. To record audio, press *Record*. This is now the time to record anything that the user would like to record. When finished recording the user must press *Stop Recording*. After selecting *Stop Recording*, select a directory to save the recording in. When “OK” is selected, a window with a list of directories will pop up. The user should select where they would like to save the recording. This recording can then be played back when associated to a button. The below figure shows a screenshot of the audio recording panel.

*This is what the Recording audio panel looks like when selected*

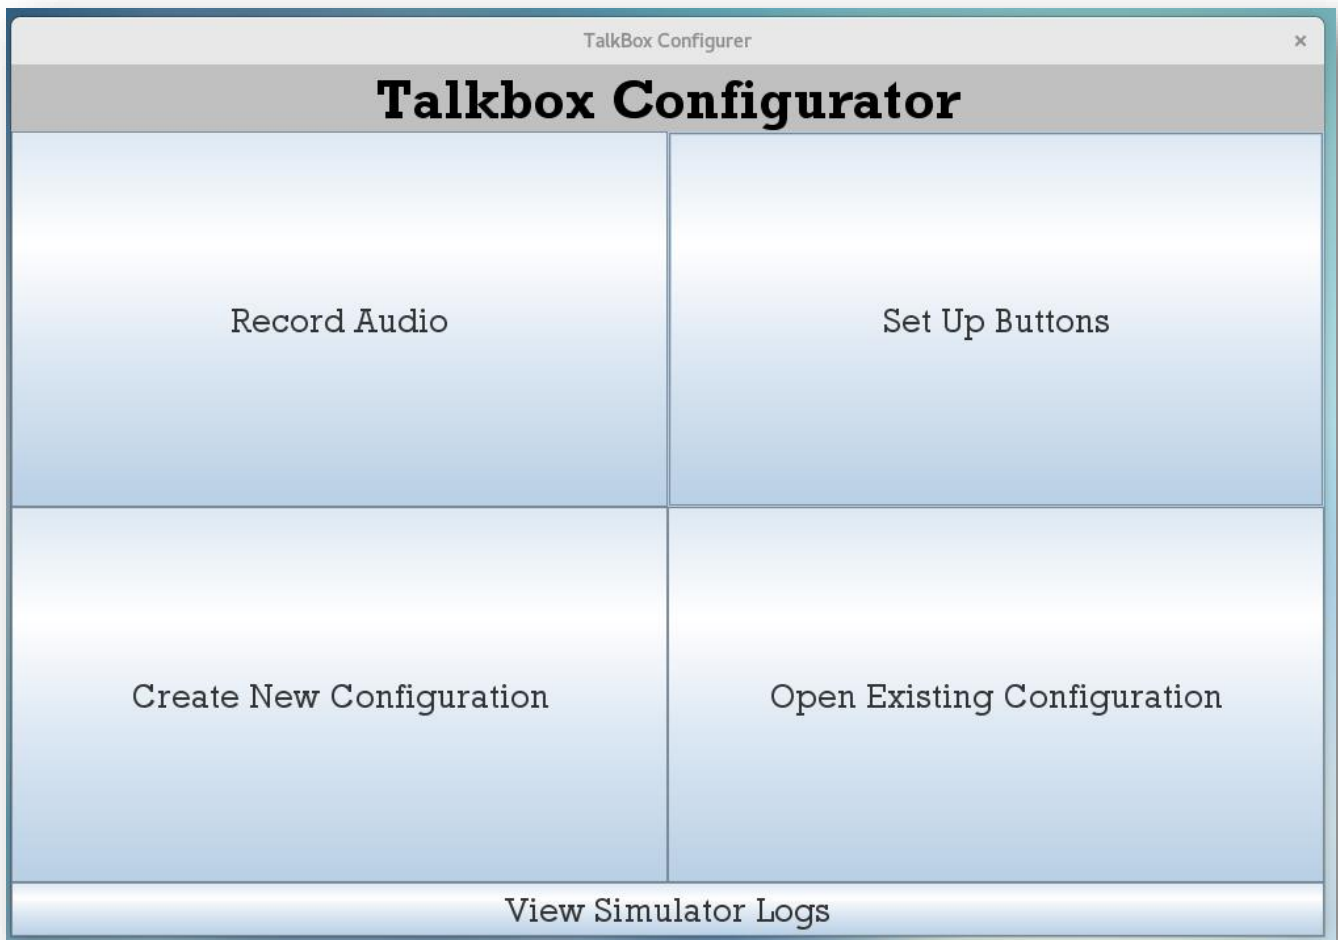

The screenshot shows a window titled "TalkBox Configurer" with a close button (x) in the top right corner. The window is divided into several sections. The top left section is a grey header with the text "Audio Recording". To its right is a light blue button labeled "Back to main menu". Below the header is a large light grey area with the text "Not Currently Recording". Underneath this is a wide light blue button labeled "Record". Below the "Record" button is a section with a label "Filename of recording:" and a text input field containing "rec.wav". At the bottom of the window is a large light grey button labeled "Stop Recording".

<b>Audio Recording</b>	Back to main menu
Not Currently Recording	
Record	
Filename of recording:	rec.wav
Stop Recording	

The **Create New Configuration** button allows the user create a new *TalkboxData* directory. New users should click this. The **Open Existing Configuration** allows the user to select an existing *TalkboxData* configuration director to allow further editing and customization.

The **Set Up Buttons** panel is not available until the user selects an existing *TalkboxData* directory or makes a new configuration directory. This is where one can setup the orientation of their buttons and can add or remove additional rows of buttons as one sees fit. In this panel the user can setup which audio clip goes to which button. They can use emojis, i.e. smile (😊) to allow the buttons to be more descriptive. The user can also name the button, change its color, or even add an image. When doing all these edits to the button, to ensure that this will be saved the user **MUST** press *Confirm Setup*.

*All five buttons fully lit up.*

By default, there are six buttons, but the user can add as many buttons as they want through the “addition” of rows. The user can also delete rows that are not needed or not to their liking. In this panel the user can also record audio and add it straight to a button. Adding an image to the button is also a feature which is very user friendly. The user can select the orientation of the image (square, vertical or horizontal).

*Visual of the setup prompt for each button. Images and sounds can be added instantly.*

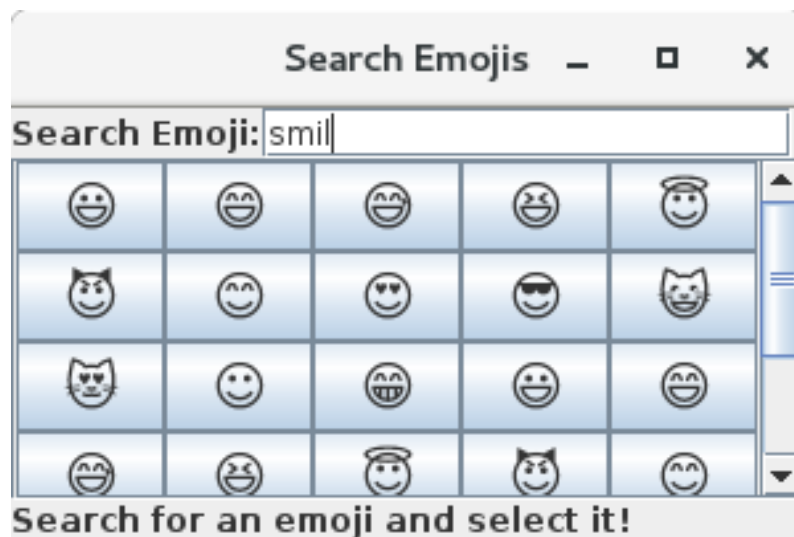

The 'Setup Button' dialog box is a window with a title bar containing 'Setup Button' and a close button. It contains several sections for configuring a button:

- Button Text:** A text input field with 'Button' entered, followed by an 'Add Emoji' button.
- Sound Section:** A blue button labeled 'Play Sound' is on the left. To its right are two buttons: 'Select Sound' and 'Record Sound', both in red text.
- Sound Path:** A text field showing '(none)'.
- Select Color:** A large blue button.
- Current Color:** A text field.
- Select Image:** A large blue button.
- ImagePath:** A text field showing '(none)'.
- Confirm Setup:** A large blue button at the bottom.

*This is the emoji panel. They can be dynamically added to buttons if one want to change its expression.*

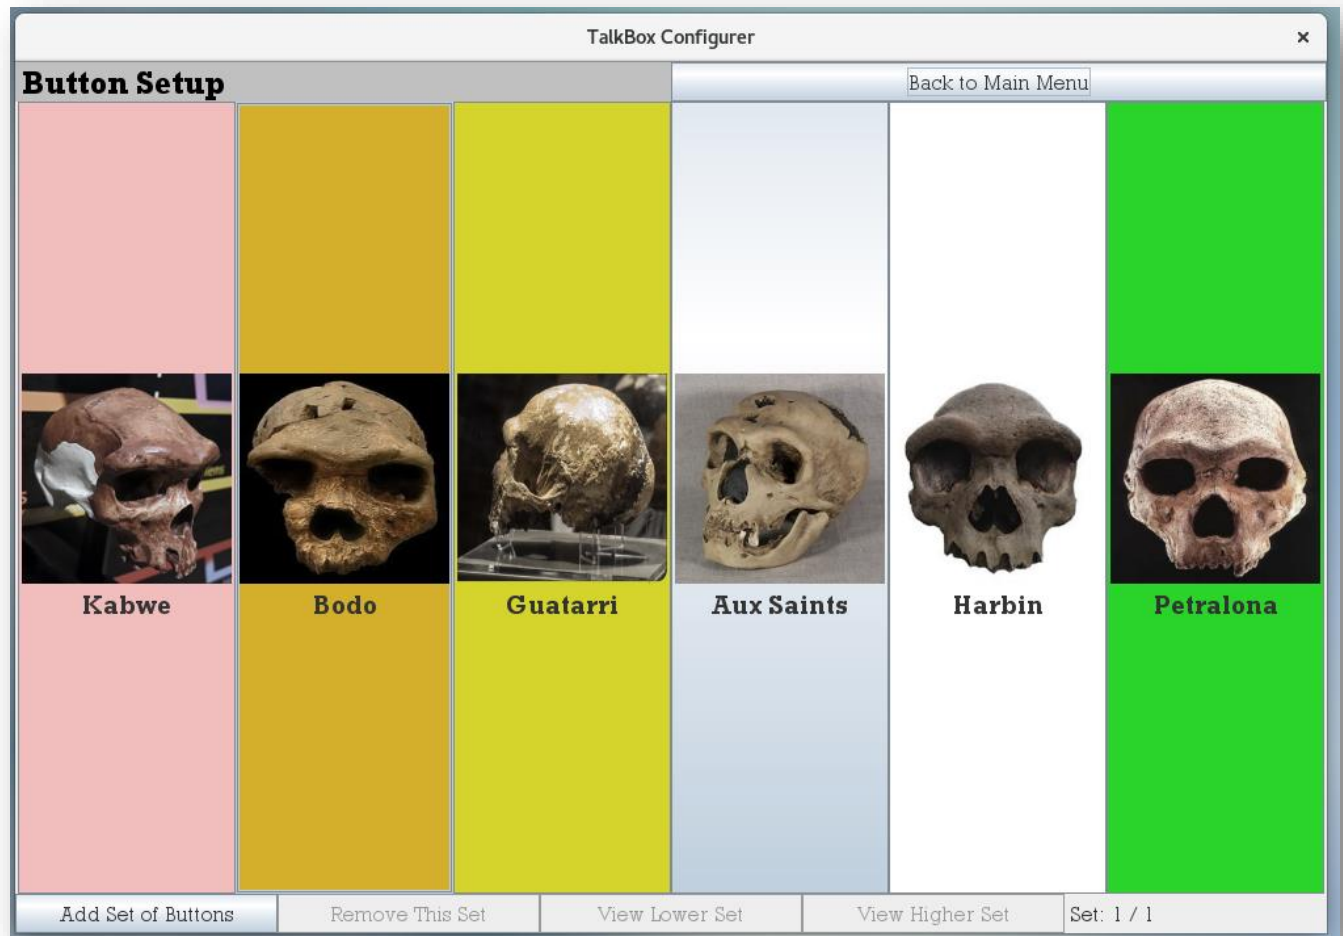

*Of course, the user can change the button color as they see fit.*

### 3 Viewing the Simulator Logs

Perhaps you, as a caregiver, are interested in the use of the simulator and whether certain buttons are being used. Maybe, there need to be different buttons for the same phrase. We record a every single user
