

TBC Log User Manual

The TBCLog application displays the history of actions recorded by the *Talkbox Configurator*. All such events (like button presses and configuration loads) are timestamped and class-named. The dropdown menu will display three buttons: *Open Log Folder*, *Reset Log*, and *Export Log*. The log folder is simply the contained in the *TalkboxData* directory. In this case, only configuration logs are loaded. The reason we cannot use a notepad for these operations is because there are multiple log files, recorded over many uses. Thus, resetting these logs and exporting them into one file are automated with this application.

The initial application state

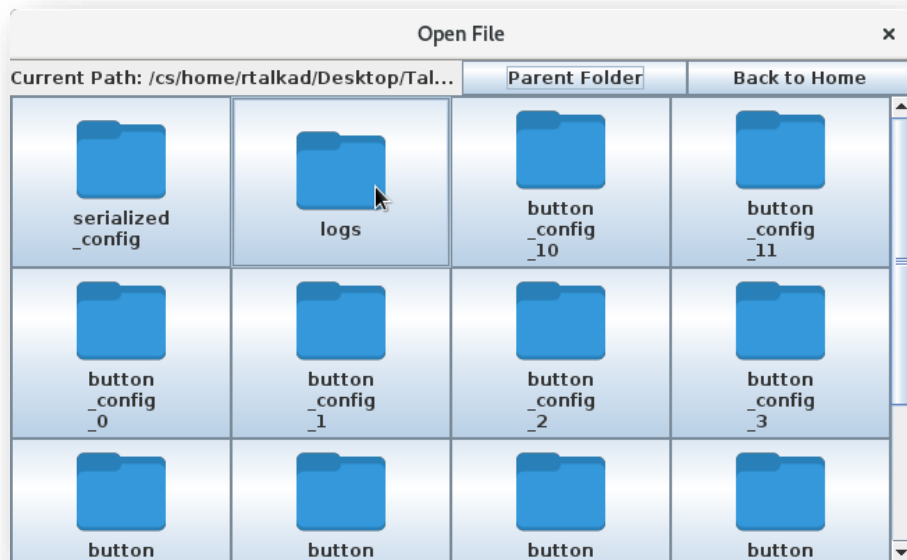

To open the configuration logs, please press **Open Log Folder**. Locate to the *TalkboxData* directory and hit logs.

Talkbox Project

EECS 2311

Alberto M., Rohan T., and Jordan M.

Now all the configuration logs will be loaded. If the logs are too long and one wishes to reset everything, press **Reset Logs**. On the other hand, if one wants to export these logs, press **Export Logs** and select which directory you would like to place them in. The file will be called **EXPORTED_LOGS**.
